

**MODEL ANSWERS TO HWK #11  
(18.022 FALL 2010)**

(1) (6.1.1)

(a)  $x' = (-3, 4)$  so  $\|x'\| = 5$ , hence

$$\int_x f ds = 5 \int_0^2 (2 - 3t + 8t - 2) dt = 50.$$

(b)  $x' = (-\sin t, \cos t)$  so  $\|x'\| = 1$ , hence

$$\int_x f ds = \int_0^\pi (\cos t + 2 \sin t) dt = 4.$$

(2) (6.1.3)  $x' = (1, 1, 3\sqrt{t}/2)$  so  $\|x'\| = \sqrt{2 + 9t/4}$ , hence

$$\int_x f ds = \int_1^3 \frac{t + t^{3/2}}{t + t^{3/2}} \sqrt{2 + 9t/4} dt.$$

We perform the substitution  $t = \frac{4}{9}(u - 2)$  and get that this equals

$$\int_{17/4}^{35/4} 4\sqrt{u}/9 du = \frac{1}{27} [17^{3/2} - 35^{3/2}].$$

(3) (6.1.7)  $x' = (\cos t, \sin t)$ , hence

$$\int_x F \cdot ds = \int_0^{\pi/2} [(-\cos t + 2) \cos t + \sin^2 t] dt.$$

It is easy to see by change of variable that  $\int_0^{\pi/2} \sin^2 t dt = \int_0^{\pi/2} \cos^2 t dt$  and so the above integral equals

$$\int_0^{\pi/2} 2 \cos t dt = 2.$$

(4) (6.1.11)  $x' = (-3 \sin 3t, 3 \cos 3t)$ , hence

$$\int_x x dy - y dx = \int_0^\pi 3 \cos^2 3t + 3 \sin^2 3t dt = 3\pi.$$

(5) (6.1.13)  $x' = (2e^{2t} \cos 3t - 3e^{2t} \sin 3t, 2e^{2t} \sin 3t + 3e^{2t} \cos 3t)$ , hence

$$\int_x \frac{x dx + y dy}{(x^2 + y^2)^{3/2}} = \int_0^{2\pi} \frac{2e^{4t}}{e^{6t}} dt = 1 - e^{-4\pi}.$$

(6) (6.1.16) A parametrization of the curve (there is more than one) is  $x(t) = (t, 5 - 4t, 2t - 1)$  for  $1 \leq t \leq 2$ . We have  $x' = (1, -4, 2)$ , hence the work is

$$\int_1^2 [t^2(5 - 4t) - 4(2t - 1) + 2(6t - 5)] dt = \int_1^2 [-4t^3 + 5t^2 + 4t - 6] dt = -3\frac{1}{3}.$$

(7) (6.1.19) Parameterize  $C$  by a curve  $x$  defined by

$$x(t) = \begin{cases} (t, t) & 0 \leq t \leq 1, \\ (t, 1) & 1 \leq t \leq 3, \\ (3, 4 - t) & 3 \leq t \leq 4, \\ (7 - t, 0) & 4 \leq t \leq 7. \end{cases}$$

Note that this curve has **clockwise** orientation, so we will remember to take  $-1$  to whatever we get in the integral. We have

$$dx = \begin{cases} 1 & 0 \leq t \leq 3, \\ 0 & 3 \leq t \leq 4, \\ -1 & 4 \leq t \leq 7, \end{cases}$$

and

$$dy = \begin{cases} 1 & 0 \leq t \leq 1, \\ 0 & 1 \leq t \leq 3, \\ -1 & 3 \leq t \leq 4, \\ 0 & 4 \leq t \leq 7. \end{cases}$$

Thus

$$\int_C x^2 y dx - (x + y) dy = - \int_0^1 t^3 dt - \int_1^3 t^2 dt + \int_0^1 2t dt - \int_3^4 (7 - t) dt = -\frac{137}{12}.$$

(8) (6.1.21) A parametrization of the curve is  $x(t) = (1 + 4t, 1 + 2t, 2 - t)$  for  $0 \leq t \leq 1$ , so  $x' = (4, 2, -1)$ . Hence

$$\int_C yz dx - xy dy + xyz dz = \int_0^1 [4(1 + 2t)(2 - t) - 2(1 + 4t)(2 - t) - (1 + 4t)(1 + 2t)] dt = -\frac{11}{3}.$$

(9) (6.2.8) Let  $D$  be the ellipse. We have  $N_x = 1, M_y = -4$ , so by Green's theorem the work equals

$$\int \int_D -3 dx dy = -12\pi.$$

(10) (6.2.10) Let  $F(x, y) = (0, x)$  so that  $N_x - M_y = 1$ . Then by Green's theorem, the area is  $-\int_0^{2\pi} a^2(t - \sin t) \sin t dt = 3\pi a^2$ . (Since  $F$  is 0 on the x-axis)

(11) (6.2.11)  $C$  is negatively oriented, and  $N_x - M_y = 5$ . So by Green's theorem, the integral is just  $-5 \times \text{Area} = -45$ .

(12) (6.2.14) We need to subtract the area of the ellipse from  $25\pi$ . Take  $F(x, y) = (0, x)$  so that  $N_x - M_y = 1$ . Then by Green's theorem, the area of the ellipse is the line integral of  $F$  on the boundary of the ellipse. Let  $(x, y) = (3 \cos t, 2 \sin t)$ . The area of the ellipse is  $\int_0^{2\pi} 6 \cos^2 t dt = 6\pi$ . Hence the area between the circle and the ellipse is  $19\pi$ .

(13) (6.2.19) The integrand vector field is smooth everywhere. Since  $N_x - M_y = 3x^2 - 3x^2 = 0$ , by Green's theorem, the integral is 0.

(14) (6.2.20) The integrand vector field is smooth everywhere. Since  $N_x - M_y = 3x^2 + 2 + 3y^2 > 0$  for all  $x, y$ , by Green's theorem, the integral has the same value as the double integral of a positive function. Hence it's always positive.

(15) (6.2.25) Let  $F = \nabla f$ . Then by the divergence theorem in the plane, we have

$$\oint_{\partial D} \nabla f \cdot \mathbf{n} ds = \int \int_D \nabla^2 f dA$$
