

**18.440 Midterm 1, Spring 2014: 50 minutes, 100 points**

1. (10 points) How many quintuples  $(a_1, a_2, a_3, a_4, a_5)$  of non-negative integers satisfy  $a_1 + a_2 + a_3 + a_4 + a_5 = 100$ ? **ANSWER:** This is the number of ways to make a list of “100 stars and 4 bars”, which is  $\binom{104}{4} = \frac{104!}{4!100!}$ .

2. (20 points) Thirty people are invited to a party. Each person accepts the invitation, independently of all others, with probability  $1/3$ . Let  $X$  be the number of accepted invitations. Compute the following:

(a)  $E[X]$  **ANSWER:**  $X$  is binomial with  $n = 30$  and  $p = 1/3$ , so the expectation is  $np = 10$ .

(b)  $\text{Var}[X]$  **ANSWER:**  $X$  is binomial with  $n = 30$  and  $p = 1/3$ , so the variance is  $npq = np(1 - p) = 20/3$ .

(c)  $E[X^2]$  **ANSWER:**  $\text{Var}(X) = E[X^2] - E[X]^2$ . Using previous two parts and solving gives  $E[X^2] = 20/3 + 100 = 320/3$ .

(d)  $E[X^2 - 4X + 5]$  **ANSWER:** By linearity of expectation, this is  $E[X^2] - 4E[X] + 5 = 320/3 - 40 + 5 = 215/3$ .

3. (20 points) Bob has noticed that during every given minute, there is a  $1/720$  chance that the Facebook page for his dry cleaning business will get a “like”, independently of what happens during any other minute. Let  $L$  be the total number of likes that Bob receives during a 24 hour period.

(a) Compute  $E[L]$  and  $\text{Var}[L]$ . (Give exact answers, not approximate ones.) **ANSWER:** This is binomial with  $n = 60 \times 24$  and  $p = 1/720$ . So  $E[L] = np = 2$  and  $\text{Var}[L] = np(1 - p) = 2\frac{719}{720}$ .

(b) Compute the probability that  $L = 0$ . (Give an exact answer, not an approximate answer.) **ANSWER:**  $(1 - p)^n = \left(\frac{719}{720}\right)^{1440}$

(c) Bob is really hoping to get at least 2 more likes during the next 24 hours (because this would boost his cumulative total to triple digits). Use a Poisson random variable calculation to *approximate* the probability that  $L \geq 2$ . **ANSWER:** Note that  $L$  is approximately binomial with parameter  $\lambda = E[L] = 2$ . Thus  $P\{L \geq 2\} = 1 - P\{L = 1\} - P\{L = 0\} \approx 1 - e^{-\lambda}\lambda^0/0! - e^{-\lambda}\lambda^1/1! = 1 - 3e^{-2} = 1 - 3/e^2$

4. (10 points) Consider an infinite sequence of independent tosses of a coin that comes up heads with probability  $p$ . Compute (in terms of  $p$ ) the

probability that the fifth head occurs on the tenth toss. **ANSWER:** This is the probability that exactly four of the first nine tosses are heads, and then the tenth toss is also heads. This comes to  $\binom{9}{4}p^5(1-p)^5$ .

5. (20 points) Let  $X$  be the number on a standard die roll (assuming values in  $\{1, 2, 3, 4, 5, 6\}$  with equal probability). Let  $Y$  be the number on an independent roll of the same die. Compute the following:

- (a) The expectation  $E[X^2]$ . **ANSWER:**  
 $(1 + 4 + 9 + 16 + 25 + 36)/6 = 91/6$ .
- (b) The expectation  $E[XY]$ . **ANSWER:** By independence of  $X$  and  $Y$ , we have  $E[XY] = E[X]E[Y] = (7/2)^2 = 49/4$ .
- (c) The covariance  $\text{Cov}(X, Y) = E[XY] - E[X]E[Y]$ . **ANSWER:**  
Because of independence,  $\text{Cov}(X, Y) = 0$ .

6. (20 points) Three hats fall out of their assigned bins and are randomly placed back in bins, one hat per bin (with all  $3!$  reassignments being equally likely). Compute the following:

- (a) The expected number of hats that end up in their own bins.  
**ANSWER:** Let  $X_i$  be 1 if  $i$ th hat ends up in own bin, zero otherwise. Then  $X = X_1 + X_2 + X_3$  is total number of hats to end up in their own bins, and  $E[X] = E[X_1] + E[X_2] + E[X_3] = 3 \cdot \frac{1}{3} = 1$ .
- (b) The probability that the third hat ends up in its own bin.  
**ANSWER:**  $1/3$
- (b) The conditional probability that the third hat ends up in its own bin *given* that the first hat does *not* end up in its own bin. **ANSWER:** Let  $A$  be event third hat gets own bin,  $B$  event that first hat does not end up in its own bin. Then  $P(A) = 1/3$  and  $P(B) = 2/3$ . There is only one permutation that assigns the third hat to its own bin and does not assign first hat to its own bin, so  $P(AB) = 1/6$ . Thus  $P(A|B) = P(AB)/P(B) = (1/6)/(2/3) = 1/4$ .
