

Problem Set 7

April 12

I want to continue the question of visualization and models on climate change more broadly, addressing the issue of audiences and forms of persuasion. Here are four ways of writing about models and debate. Read them and then go online and look at different ways of presenting data on climate change. Pick at least two that you find persuasive (these can be visualizations or websites) and discuss on the MIT server why you found them persuasive and whether or not the Oreskes Science article helped you thinking about this -- be sure to bring in at least one concept from the readings.
